Home Work

1. To the app we wrote in class:

   Hello World!!

   My name is **itay** and my age is **43**

   _____
   | Click me |

   | Hover me.... |
   Add a button which print "double-click" when event of double-clicks occurs

   - create a button and while hovering over the button
     it prints the x,y location of the mouse into a label .hint: store the x and y in the
     state, and use a large button (see below)

   x = 30

   y = 100

   detect x,y

```
...
  state = {
          mouse_x: 0,
          mouse_y: 0
        }
...
<button style={{ height: 300, width: 300 }}>detect x,y</button>
```

create a form-submit which also contains select-html-component, check-box, and a calendar. make sure all values are stored in the state of the component and updated upon user selection

name _____

vegetarian yes/ no – checkbox

birth day

country [drop-down]

gender: radio button : male , female
